

## We are so excited!!!

The Graphite speaker cable was referred to as “the best speaker cables I’ve ever heard” by one reviewer and the Black Diamonds leave our fantastic Graphite range a long way behind in terms of performance and compatibility.

To give you an idea of what is different, this is what our first overseas client said of these when they changed them for the Graphite speaker cables, and typical of comments since from clients since then:

*“The cables are arrived and they are simply fantastic!!!*

*More inner resolution and the same time smooother which is very hard to do in high end. The bass has also more control and the same time better integrated with the rest and all this without burn in!!! Great work !!!”*

While the Graphite's sound is incredible in most systems there were a few who reported that they actually sounded “wrong”, a little thick and heavy. This only occurred on very few systems but gave us something new to launch into researching. (We love a challenge because no matter what else we always learn something new).

During our research we played with a few new material mixes (one being a specific mix of Tellurium Copper for the connectors). Other things we altered ..... well we are known for not commenting on the construction, materials and manufacture processes (see our pdf, “why no tech specs” on our website) but the result was something a lot more compatible but also with a performance that surprised us and meant we had a new reference level cable.

When you hear for yourself the Graphite against the new Black Diamonds you will be in no doubt which is which even though they look similar.

The same is true (and also to the same extent) for the new Black Diamond RCA, which uses the new Tellurium Q<sup>®</sup> RCA connector made from a specific alloy of TeCu
